

Supplementary Materials

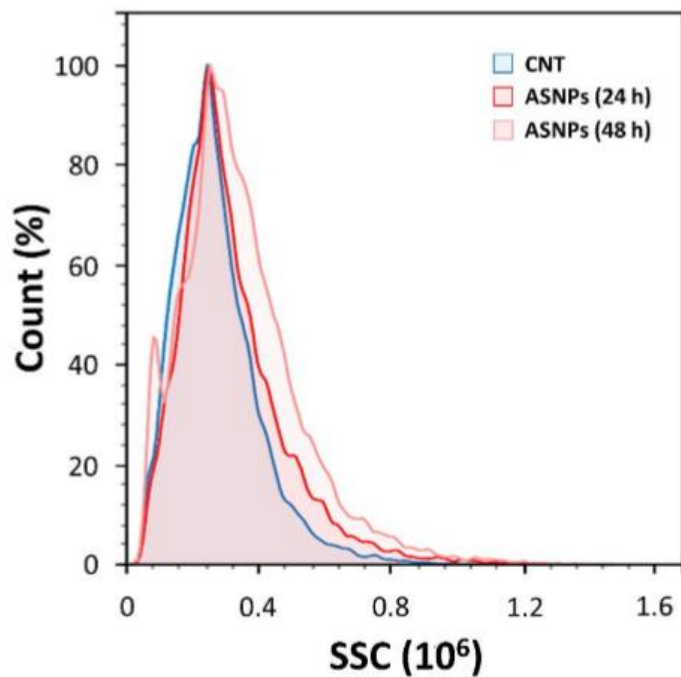

Figure S1. Flow cytometry analysis of α -syn-expressing cells exposed to ASNPs. α -Syn-expressing cells (HiTox strain) were grown on SGal medium with or without ASNPs (100 ng/ μ L) for different times of incubation (24–48 h) prior to flow cytometry analysis. A time-dependent increase of SSC signals was observed in ASNP-treated cells compared with control (untreated; CNT) cells, indicating that these NPs were internalized in yeast cells, but probably to a lesser extent than CeO₂ NPs (see, for comparison, Figure 2b).
